Electronic Materials Letters -
Springer - A magnet is a material
or object that produces a
magnetic field. This magnetic
field is invisible but is responsible
for the most notable property of a
magnet: a force that pulls on
other ferromagnetic materials,
such as iron, and attracts or repels
other magnets. The overall
strength of a magnet is measured
by its magnetic moment or,
alternatively, the total magnetic
flux it produces.

Magnet - Its Clinical Potential -
Wikipedia - Abstract. DNA
nanotechnology is an emerging
and exciting field, and represents
a forefront frontier for the
biomedical field. The specificity
of the interactions between
complementary base pairs makes
DNA an incredible building
material for programmable and
very versatile two- and
three-dimensional nanostructures
called DNA origami.

memristor (/ Ē^ m Ē> m r Ē^ s t
Ē™r /; a portmanteau of memory
resistor) is a hypothetical

non-linear passive two-terminal
electrical component relating
electric charge and magnetic flux
linkage. It was envisioned, and its
name coined, in 1971 by circuit
theorist Leon Chua. According to
the characterizing mathematical
relations, the memristor would
hypothetically operate in the
following way ...
